COMPANY

MÜHLBAUER GROUP AT A GLANCE

Founded in 1981 in the heart of Bavaria, the Mühlbauer Group has ever since grown to a leading global player in the fields of Parts & Systems, Semiconductor Related Products, Document Solution Related Products and Tecurity® Solutions. With around 3,500 employees, technology centers in Germany, Malaysia, Slovakia, the U.S. and Serbia, and 35 sales and service locations worldwide, Mühlbauer created a strong competence network around the globe. We continuously invest in the latest technologies and innovative processes to enhance our competences and to provide you with optimized solutions. Our in-house precision part production – MPS – Mühlbauer Precision Parts – guarantees unlimited flexibility and highest customer satisfaction.

Our business unit **AUTOMATION** does not only develop and assemble individually customized production systems, but also provides matching software solutions for the production process of Document and Solution Related Products. Vision inspection technologies as well as semiconductor and RFID applications complete our comprehensive portfolio. Our business unit **TECURITY®** is established as a competent partner for the implementation of security systems for identifying and verifying both documents and individuals. Our clients benefit from more than three decades experiential value which we have gained during the realization of over 300 ID projects worldwide.

Mühlbauer launches MB PalaMax® production platform

2018
Opening of the Technology Center in Newport News, USA

PROCESS

PROCESS OVERVIEW

CONCEPTION

Comprehensive planning is the key to every successful project. The client's individual requirements combined with our extensive know-how determine the outline of the solution's architecture. After extensive consultation we develop a detailed project plan which includes every step of the process – from the design to the issuance and the verification of the personalized documents. Furthermore, the hardware and software infrastructure, the administration and logistics, the cooperation with local suppliers and staff, as well as further service and

maintenance options are all essential subdivisions which have to be taken into consideration. Not only the detailed security concept, which determines the document's design and the security features applied, is of particular importance, but also the project's infrastructure and networks according to the latest security standards. Our specialists from a variety of departments cooperate closely. They accompany the project right from the beginning and thus ensure an efficient and reliable planning so that the optimal customized solution is achieved.

ENROLLMENT

Every human being is unique. An individual's biometric combination is defined by 260 individual optical characteristics of the iris, the pattern and minutiae features of the fingerprint and a multitude of different attributes of the personal signature. The use of this biometric data has made it possible to identify and verify any arbitrary person. The enrollment process of sensitive data requires comprehensive know-how and upmost care to ensure that the collected data serves the project's requirements.

The flexible design of the Mühlbauer getID systems allows for the provision of customized enrollment. Data can be captured by form or live, in a centralized or decentralized enrollment-station, depending on the project's structure. A set of functions manages the capturing of the applicant's documents, the separate approval steps, as well as the payment process. Irrespective of the form the client chooses, data security is preserved at any time while capturing the individual's personal attributes.

IRIS ●
FACE ●
FINGERPRINT ●

DATA MANAGEMENT

Personal data is one of the most valuable goods. Since the use of personal and biometric attributes for any form of identification or verification has become increasingly common, secure management and processing of the captured data is crucial. In order to ensure the optimal handling of the enrolled and verified datasets throughout any part of the application and document lifecycle, we have established our most effective software infrastructure and solutions.

The identification process is supported by a standardized interface to the biometric identification and verification system comprising fingerprint (AFIS), iris (IRS) and face recognition (FRS) and thus enabling highest interoperability with any sensor technology in the market. Most importantly, our data management structure sets highest security standards by using the latest encryption technologies. It reliably protects the datasets from any form of abuse, counterfeit or even identity theft.

PRODUCTION

The complexity of ID documents constantly increases. Growing security needs as well as organized document fraud demand the continuous enhancement of secure documents. As one of only a few chosen companies worldwide, we are certified as security printer and security supplier by INTERGRAF and consequently hold significant expertise in the development of customized ID solutions. Our document and forensic specialists create documents which are fully equipped for future demands. They commence with comprehensive consulting to define the document solution design, but also take into consideration all the prospective requirements. Working with equipment generated by ourselves, we continuously monitor and enhance the quality and security features of our products. Additionally, we have developed high-end materials which merge all the advantages for document production and personalization with document security. Our core competence is to provide our

customers with optimized solutions and documents perfectly protected from manipulation and fraud. As regards the production process of ID documents, MB PalaMax®, our in-house SmartFactory Production & Process Management Software, allows for the collection of complete real-time production data. MB PalaMax® allows for total transparency of the production process. It provides an interface for process monitoring and statistical analysis of the production process. Thus, it supports the production planning to optimize and control the cost drivers during the production process. MB INCAPE is Mühlbauer's proven software solution for the management of production processes for ID Documents. It covers the complete organization of production, job, data and material handling. With MB PalaMax® and MB INCAPE, Mühlbauer has laid the groundwork for a comprehensive Manufacturing Execution System (MES), which takes manufacturing execution to the next level.

PERSONALIZATION

A personalized ID document is the key to identify an individual. By transferring both the personal and the biometric data to the blank document, the ID card, the passport or the license becomes unique. This is the only way to achieve a reliable verification.

Depending on the individual requirements, a comprehensive portfolio of the latest technologies, including high-end printing, laser engraving and lamination systems, guarantees the efficient application of the visible attributes on the medium's surface. The personal and biometric data's secure and encrypted

transfer to the embedded storage chip is supported by a production management solution with interfaces to the latest Public Key Infrastructure (PKI) and background systems. During the personalization process, all material movements are controlled by large material management systems. Constant and thorough quality checks ensure the complete and correct registration of the prepared datasets, thus making sure that only authenticated data is transferred from the central database. With regard to your personalized documents, we are committed to the highest international security standards.

VERIFICATION

International traveler volumes rise on a daily basis. A multiplication of airport arrivals and departures, illegal migration and organized crime lead to greater challenges in the globalized world. Reliable verification systems become essential to cope with these trends. Our innovative access and border control solutions offer the highest level of security and accuracy with regard to the identification of the individual and the verification of the personal data which are captured by means of MB ABIS (Automated Biometric Identification System). Latest security standards apply to the verification of ID documents before sensors capture the biometric attributes. Then they are matched with the datasets which have been identi-

fied with Mühlbauer's modular and scalable enrollment platform MB getID in advance. The highly flexible system design allows for a tailor-made solution according to the client's requirements. It combines different types of fingerprint sensors, face or iris cameras. Automatic quality assessments guarantee maximum matching accuracy in our solutions so that national interests are preserved and overall security is increased.

By means of standard mobile devices such as smartphones or tablets, our new mobile application, MB Steel Reader Mobile, even allows for a secure mobile verification of the passenger's travel document at any time and in any place.

SOLUTIONS

ID CARD SOLUTION

We excel in providing innovative ID card solutions. Customized design, security elements meeting the latest standards, constant enhancements and in-house developed high-end materials and technologies guarantee the production of optimized, highly durable and unforgeable documents.

The customized design of our solution allows for the setup of an individual infrastructure for the personalization and issuance of ID cards. A decentralized enrollment of the applicant's data followed by the data management at a central site enables the most flexible and efficient process handling. Afterwards, the blank document is personalized in a decentralized location so that the finished ID card can be issued locally. Decentralized enrollment and issuance simplifies not only the access to ID documents for the whole population, but also the complete capturing of the citizens' data.

COVER

Patented production technologies, in-house developed materials, high-quality personalization techniques, customized security features, as well as our unique hinge technology form the key elements of our ePassport solutions. In compliance with our customers' individual requirements, we provide high-end solutions for fraud-resistant documents.

Our flexible solutions enable the secure issuance of citizens' ePassports worldwide. Embassies abroad act as decentralized enrollment sites which are connected to the high-secure data infrastructure. The enrolled datasets are securely transferred to the central data management site in the home country for registration and further processing. Before the ePassports are issued at the respective embassies, production and personalization are carried out in a centralized location. We also guarantee highest flexibility for the citizens living abroad applying for ePassports and for the replacement of traveler documents in foreign countries.

VERIFICATION SOLUTION

FACE

Face recognition systems use facial biometrics in order to identify an individual. Verification is achieved by means of cameras which capture the facial attributes before the MB FRS (face recognition system) automatically matches the biometrics with the enrolled dataset.

IRIS

Staying almost unaltered for a lifetime, the human iris serves as an individual's most reliable verification feature. During the verification process, recognition sensors supported by MB IRS (iris recognition system) take pictures of the iris and automatically match them with the data stored in the embedded chip.

FINGERPRINT

The individual fingerprint is defined by unique patterns. The flexible MB AFIS (automated fingerprint information system) reliably supports any sensor on the market. It captures and matches various forms of fingerprints, ranging from the verification of just one fingerprint up to the verification of both hands at the same time.

We provide you with comprehensive turnkey solutions for the efficient and reliable verification of documents and travelers at governmental borders. Individually configured Automated Border Control systems ensure the efficient handling of passengers in just seconds. They verify the validity of the ID document, match the enrolled personal and biometric data with the life data and even check them for watch list entries. Additionally, mobile devices and getID Mobile systems are used for the flexible verification of the individual.

DRIVER'S LICENSE & VEHICLE REGISTRATION SOLUTION

WINDSHIELD STICKER

The RFID tag holds a chip with a unique, unforgeable serial number. Upon removal, the tag is destroyed and thus made secure against theft. When reading the chip with a RFID device, the serial number is matched with the central database, thus ensuring the reliable identification of the vehicle holder by authorized personnel only.

LICENSE PLATE

A unique number is assigned to a vehicle enabling the definite identification of its holder. The license plates are read out by cameras or, if equipped with a chip, by RFID devices and matched with the information in the central database. Apart from the verification of the vehicle owner, the system also enables tax and insurance data checks, and even speed and access control.

DRIVER'S LICENSE

The driver's license holds all necessary information about the vehicles drivers are allowed to operate and if there are any further constraints to their driving abilities. In order to render the document unforgeable, high-end security elements and technical features are applied according to the customers' individual requirements.

Driver's License Bosnia & Herzegovina

VEHICLE LICENSE

The high-end fraud-resistant license contains all the data of the owner and the vehicle's technical specifications, thus ensuring the reliable identification of any vehicle liable to registration. The customized document is designed according to the latest security standards. It can optionally be equipped with an embedded chip for an even more simplified verification process.

Vehicle License Georgia

We excel in providing complete vehicle registration and license solutions. Our customized infrastructure network enables a reliable identification and verification of drivers, vehicles and their holders. Supported by our cutting-edge smart card and RFID technologies and data management systems, high-volume verification can efficiently be carried out. By matching visible attributes and enrolled data with the central database, stationary and mobile devices ensure comprehensive traffic control throughout the complete road network.

300 ID PROJECTS WORLDWIDE

As one of the world's leading single-source providers of innovative and high-end security solutions, we are currently involved in more than 300 ID projects worldwide. Our successful projects range from basic solutions up to the most complex BOT-projects (Build-Operate-Transfer), including the development of a multitude of documents, vast hardware and software infrastructure measures, comprehensive trainings, as well as extensive service.

With the successful completion of numerous projects, we have developed decisive know-how and experience in defining and implementing tailor-made solutions that meet our clients' individual requirements. We do not only deliver the customized high-end systems. More importantly, we also accompany our clients before, during and after the project. We are proud to support various nations on all five continents to further enhance their security infrastructure.

The ID card personalization project of Algeria was awarded by the Ministry of the Interior and of Local Authorities and started in August 2015. Mühlbauer closely cooperated with the Ministry to deliver card personalization equipment and a production and personalization management system for two personalization centers in Algiers and Laghouat. The centers have been equipped to personalize the new Algerian ID Card by laser engraving (image and personal data of the card holder) and chip encoding on a hybrid card. To interconnect the production and personalization management with the existing infrastructure and to ensure a smooth implementation, Mühlbauer coordinated with local partners. During the first year of operation, Mühlbauer provided supervision staff at site to support the ramp-up. Moreover, the local staff received a comprehensive training on the systems, in order to

guarantee the facility's efficient operation. Due to the successful completion of the first project, Mühlbauer was engaged for a follow-up project in 2016: the delivery of a complete Smart Card factory for the production and personalization of up to 5 million national driver's licenses and vehicle registration cards per year. The project included the delivery and setup of the complete plant, the development of a security concept, the systems for card body production, laser pre-personalization, inspection and personalization with MB ALFRESCO® technology, as well as the installation of the proven production and personalization management system MB INCAPE. Besides, a comprehensive service package was included: customer staff received an all-inclusive training and Mühlbauer delivered the know-how transfer to enable the smooth operation after hand-over, including the new production unit DIN ISO certification.

SCP 801

MB ALFRESCO® PICTURE

REPUBLIC OF ANGOLA

CIVIL REGISTRY

The civil registry project of the Republic of Angola, awarded by the Ministry of Justice and starting in 2014, was designed to improve security standards in Angola and optimize the interoperability between ministries through a reliable database. Mühlbauer worked in close cooperation with its partner on site to provide the complete infrastructure for an accelerated and secure national registry of all citizens.

Within only six months, Mühlbauer provided the complete hardware and software infrastructure comprising about 200 decentralized enrollment sites which are equipped with a total of 525 easy-to-operate MB getID systems. They enable the comprehensive capturing of the applicants' demographic and biometric data and the scanning of official documents.

17 decentralized DEOS-sites have been established to process the collected data and send it to designated notaries for verification. Thus, it is ensured that the registered individuals are legal citizens of the Republic of Angola. The verified data is stored in the central national register in Luanda. It manages all data to avoid duplicated identities and handles all relevant registration steps such as birth registration.

Once an applicant's data has been enrolled, a confirmation letter is issued. It is valid as soon as the data has been verified and serves as a breeder document for further ID documents. Due to extensive training, the local staff has been enabled to autonomously register 8 million people in a minimum of time.

COMMONWEALTH OF AUSTRALIA

ePASSPORT PERSONALIZATION

The Australian ePassport project was awarded by the Department of Foreign Affairs and Trade (DFAT) in 2013: The project was supposed to both renew all personalization equipment and introduce a comprehensive solution (including quality print and lamination of data pages) for an average annual volume of 2.5 million ePassports. Thanks to a previous successful cooperation, Mühlbauer was designated to provide the complete personalization hardware and software, as well as the personalization management system. The 5-year project also included the seamless integration of the new system's seamless integration into the existing infrastructure the supply of the complete line consumables for the project, the training of local staff, which was provided by experienced on-site staff, as well as the provision of full-time local maintenance and service support.

For the personalization of the ePassports, two centers with high-volume personalization equipment were set up in Melbourne. Additionally, documents are personalized in nine domestic and two foreign state offices in London and Washington D.C., which are all linked to the central data site and equipped with desktop-personalization systems. In the course of the personalization process, MB IN-CAPE, collects the datasets from the central secure document management system, transfers them to the personalization center and prepares them for the further processing. Then the ePassports are personalized with the prepared datasets. The finalized documents are issued to the applicants by means of secure, high-speed passport mailing systems. Applicants can directly collect the finished documents in the domestic and foreign state offices.

MB IDENTIFIER 60

ePassport Mailer

BOSNIA & HERZEGOVINA

DRIVER'S LICENSE, NATIONAL ID CARD & ePASSPORT

The Agency for Identification Documents, Registers and Data Exchange of Bosnia and Herzegovina (ID-DEEA) has selected Mühlbauer to deliver the hardware and software for the production of ID-1 card bodies and ePassports. The card and passport production processes are managed by the Mühlbauer production management system MB INCAPE and the material management system MB Warehouse. These systems are located at the Mühlbauer production facility in Banja Luka. They are responsible for planning, processing, controlling and handling all production orders and material for the card and passport production center.

The Bosnia and Herzegovina ID card is successfully issued since March 1st, 2013. The image of the ID card holder is pre-personalized in line with the latest technology for color images on ID documents and stored in one of the inside layers of

the polycarbonate, thus preventing any possible misuse. All personal data and machine-readable zones are laser-engraved in the second inner layer of a polycarbonate card. Personal and other data are stored within the chip module in a digital and highly secure manner. The third-generation ePassport with Supplemental Access Control (SAC) has successfully been issued since October 1st, 2014. The passport holder's image is pre-personalized in line with the latest technology for color images on ID documents and stored in one of the inside layers of the polycarbonate, preventing any possible misuse. All personal data, ghost image and machine-readable zones are laser-engraved in the second inner layer of a polycarbonate page. Personal and other data are stored within the chip module in a digital and highly secure manner, in line with the latest standards.

REPUBLIC OF THE CONGO

NATIONAL ID CARD & ePASSPORT

The Congolese identity project, awarded by the Ministry of Interior and starting in late 2011, comprised the development and implementation of the customized infrastructure for the issuance of high-secure ID documents. Serving as a model example for the setup of a complex system, this solution includes an extensive range of documents. Along with the existing database, the registry forms the basis of the complete national census of all citizens.

The project started with comprehensive consulting and the development of the system architecture involving the setup of 800 decentralized mobile getID enrollment units. 105 decentralized DEOS-sites collect and process the data. From there, they are transferred to and managed by the central data-

base SDM. The high-secure blank documents, produced and delivered from Mühlbauer Germany, are personalized in three sites in the capital city Brazzaville, in Oyo and Pointe-Noire. From there, the finished documents are forwarded to the decentralized sites for issuance. 33 embassies abroad have been equipped with units providing for enrollment, personalization and issuance of visas, substitute passports and consular cards.

Another part of this successful project is the police card solution, involving the complete hardware and software infrastructure for the registry and issuance in five decentralized offices, as well as the central database and the personalization of the blank documents in Brazzaville.

REPUBLIC OF EL SALVADOR

NATIONAL ID CARD

In 2011, Mühlbauer was awarded by the Government of El Salvador to implement and operate a comprehensive National ID Card Solution for the people of El Salvador. The solution comprised twenty enrolment-, personalization- and issuance offices in El Salvador. In addition, Mühlbauer enabled 16 El Salvadorian consulates in the USA and Canada to receive applications and issue National ID Cards to El Salvadorian citizens.

The solution comprised the actual ID card, approval and issuance clients, national database, biometric system, data and document management system, secure communication with all sites, (national and international) via DEOS, as well as personalization

machines and software. The project is based on a Public Private Partnership agreement and executed as a Built-Operate-Transfer (BOT) project.

In June 2015, the BOT-project was renewed for five additional years. Within the scope of the contract extension, the second generation of ID cards, with enhanced security features, will be issued. The Government intends to issue 3 million ID cards within the first 15 months, and a total of seven million cards from 2015 to 2020. Today, Mühlbauer employs over 250 people in El Salvador. Mühlbauer El Salvador, with its qualified staff, is the backbone for all Mühlbauer operations in Central America.

National ID Card – Front

National ID Card – Back

GEORGIA

NATIONAL ID CARD & eGATES

The national identity project of Georgia was awarded by the Public Service Development Agency of the Ministry of Justice and started in 2010. The introduction of the most advanced eID card worldwide set a milestone in the field of ID document solutions. The polycarbonate dual interface card does not only serve as a national ID document, it also holds an embedded chip for different services like digital signature, eBanking, eHealth, access control, payment function and public transport applications. This project is an outstanding example for the seamless integration of established standards and latest innovations into an existing infrastructure. The system architecture was enhanced by a centralized personalization site in the capital city and two decentralized sites; all of these centers were equipped with the latest personalization technology

and mailing systems for the issuance of the finished documents. Five getID mobile units were added to the existing network of decentralized enrollment sites. Mühlbauer produced the high-secure blank documents in Germany and quarterly delivered them to a central warehouse in Georgia. They were then distributed to the three personalization sites. In 2011, the follow-up project was awarded by the Ministry of Internal Affairs: the implementation of Automated Border Control units at the higher frequented Georgian airports of Tbilisi, Batumi and Kutaisi, and at four pedestrian border crossing points. The fast and reliable verification of Georgian citizens includes the matching of a person's individual data with a variety of databases like the citizen register and several watch lists.

National ID Card – Front

National ID Card – Back

Automated Border Control

REPUBLIC OF GHANA

ENROLLMENT, ePASSPORT PERSONALIZATION & INSTANT ISSUANCE

The ePassport issuance solution project for the Republic of Ghana started in 2015. It has set a new worldwide standard as it is the first solution which includes decentralized personalization on site and instant issuance of the finished ID documents outside the home country. Within only two months, six sites have been set up in embassies in Europe, North America and South Africa. The Ghanaian embassies act as decentralized centers where citizens can apply for new documents and have their complete demographic and biometric data enrolled. All centers are connected to the governmental national database in the capital Accra. Where the applicants' captured data are used to make sure that they are legal citizens. The

data is securely transferred to the central database by means of the latest encryption technologies. All newly captured data and all acquisition processes are registered in the national database granting full transparency to the Ghanaian institutions worldwide. Within a short space of time, the blank ID documents can be personalized with the applicant's prepared dataset by means of high-end desktop personalization equipment. Before the finished document is handed over to the applicants, they have to be verified once again. For this purpose, MB getID collects the citizen's live data and matches them with the stored data. Within the smallest amount of time, Ghanaian citizens are provided with their new ID documents.

MB getID Mobile

MB IDENTIFIER 6

GIBRALTAR

NATIONAL ID CARD

The ID card project for HM Government of Gibraltar features Mühlbauer's most advanced ID card with a variety of integrated services. The idea behind the project was to provide a high-secure biometric ID (and travel) document which significantly simplifies government services for citizens. The eID card ensures the secure log on to a newly developed web portal to access all electronic services. Moreover, the eSignature functionality makes it possible to digitally sign electronic documents. The eID card also allows free access to education centers, libraries, parking and public transport. The new ID card itself is a highly durable PC (polycarbonate) card with outstanding security features. It is issued to the applicants after their existing documents have expired. Mühlbauer provided the complete hardware and software infrastructure and seamlessly integrated it

into the existing environment. Local staff received extensive training in advance to ensure the smooth operation during the ramp-up, which was also accompanied and supported by Mühlbauer. The enrollment centers are equipped with 10 getID systems which capture the demographic and biometric (facial image) data. After the enrollment, the data is processed and transferred to the personalization management system which initializes the personalization of the blank document by laser engraving and chip encoding. The customized personalization systems, which are already used for the personalization of Gibraltar's driver's licenses, have been upgraded with chip coding and vision inspection modules to enhance their functionality. After the identity is authenticated at the enrollment and issuance center, the citizen receives the new ID card within a few days.

REPUBLIC OF INDONESIA

NATIONAL ID CARD

The national ID card project for the Republic of Indonesia started in January 2012. It was commissioned as a result of the national census which indicated the necessity of advanced ID documents for the entire Indonesian population. That is why 112 million contactless ID cards with a NXP chip module were determined as project volume. Within only three months, a state-of-the-art production site and a high-secure personalization center meeting the latest security standards were set up in Jakarta. They are not only seamlessly integrated into the existing infrastructure, but also connected to the governmental national database. In addition to cutting-edge production and personalization ma-

chines – including thermo-transfer full color printing units – the sites were also provided with extensive software equipment like the reliable MB INCAPE system. Furthermore, a high-end inspection machine, which thoroughly checks the quality of every blank document, ensures a zero-fault rate. The extremely fast setup, the complete delivery and the comprehensive know-how transfer ensured the awarding of the project contingent and set the world record for a project of this size. Within only eighteen months, the complete demand of ID cards was personalized with a throughput of 500.000 cards per day. This was one of the biggest and most challenging ID card projects in the company's history.

National ID Card – Front

National ID Card – Back

REPUBLIC OF IRAQ

DRIVER'S LICENSE & VEHICLE REGISTRATION

The Iraqi driver's license and vehicle registration project started in 2010 and represents the exemplary solution for the setup of a complete infrastructure. The solution comprised a central data site and a disaster recovery center in Baghdad and 20 decentralized sites. They are all equipped with live data enrollment hardware and software, offline enrollment units for the registration of the demographical and biometric data (fingerprint and iris), high-end laser document personalization and number plate pressing, as well as the issuance of the finished documents. The data is registered live, then processed and – depending on the distance to the capital city – transferred to the central data site either by VSAT or fiber optic. 2 million blank documents with high-end security features are delivered from the production site at Mühlbauer

Germany to a central warehouse in Baghdad. From there, the documents are distributed to the decentralized sites issuing the complete set of documents, e.g. the vehicle registration card, the windshield sticker and the driver's license, along with the license plates. The high-secure software infrastructure comprises the complete data management, personalization management and data security. The system architecture provides access to the central data site by authorized governmental institutions via web portals. Thus, the checking of the individual's complete registered and stored data is possible. The authorities received handheld devices for car inspections (taking place within assigned checkpoints) which are connected to the central database so that the data can easily be matched.

REPUBLIC OF MOZAMBIQUE

DOCUMENT ISSUING SOLUTION AND BORDER MANAGEMENT SYSTEMS, ID CARDS, TRAVEL DOCUMENTS & VISA

In 2018, the authorities of Mozambique awarded a concession with a contract period of eight years on the basis of a public-private partnership (PPP) model to Mühlbauer. The project's scope was it to deliver, distribute, install and ramp-up a state-of-the-art system for the issuance of multiple types of identification documents for citizens and visitors. The project also included a border crossing solution and training of staff. It was to be delivered within a period of just six months after the contract signature. The management systems were distributed nationwide to 12 provinces and 177 districts, to all 13 airports, to 31 land, river and sea borders and to 45 embassies and consulates worldwide. The system can be fully operated online and offline (depending on network availability) and has the highest IT security standards regarding data security, data transfer and data loss. The system consists of

four independently operable data bases for four independent authorities (citizen data, foreigner data, travel documents and border management) which are all interlinked and interoperable for national security and information purposes. On a nationwide basis, the government issues biometric national identification cards and electronic travel documents, as well as biometric emergency travel documents for all citizens of Mozambique. In embassies and consulates, the issuance of travel documents, identification cards and emergency documents for nationals of Mozambique is supported as well. For visitors, biometric visa documents can be issued at all airports and border posts, as well as in consulates and embassies. Furthermore, resident alien cards and biometric emergency travel documents for foreigners as well as United Nation travel documents are produced.

REPUBLIC OF SOUTH AFRICA

ENROLLMENT FOR DRIVER'S LICENSE

In January 2016, the contract with the South African Driving Licence Card Account (DLCA) of the Department of Transport was finalized: It set off a comprehensive project for the provision of the new Live Enrollment Units (LEU) named "MB getID BOX" for the driver's license applications in South Africa. They replaced the outdated systems which had been used throughout the whole country for over a decade. Mühlbauer was working in close cooperation with a local company to deliver 1000 LEUs which were distributed among 406 Driving Licence Testing Centers (DLTC) across all nine South African provinces.

The project's central effort was the development of customized units within a short amount of time. These units all have peripheral devices, such as scanners, camera and eye testing system permanently and securely installed in a specially designed casing. The devices capture the applicants'

demographic and biometric (face, fingerprint, signature) data. Afterwards, an acuity and peripheral vision test is conducted. The customized units are designed to accommodate all existing back-end system interfaces to ensure seamless replacement. Moreover, a special and intuitive user management was developed.

In order to monitor the LEU's activity across the country, a special control system was set up: It tracks the coordinates, makes them appear on a dedicated location map and checks the availability of the units, as well as the entire infrastructure in terms of failures in applications, services, servers and devices. An additional part of the project was the formulation of a successful change management program. It included the conduction of a comprehensive training to enable the local partners to operate the new systems and to train further operators in turn.

REPUBLIC OF SOUTH SUDAN

NATIONAL ID CARD, ePASSPORT & VEHICLE REGISTRATION

The South Sudan BOT-project (Build-Operate-Transfer), awarded by the Ministry of Interior in 2011, is the best practice example for a comprehensive document solution. It encompasses the national ID card and ePassports, the driver's license and the vehicle registration system. The system architecture (including a disaster recovery system for production and accessing ID documents at embassies abroad) and the design of the polycarbonate documents, which were determined by technical and geographical requirements, were established in close collaboration with the authorities at site. With regard to a complete know-how transfer, the local staff received comprehensive training during the course of the project to ensure an autonomous operation of the system. The infrastructure comprises the central site, loca-

ted in the capital Juba, which process and manage data of each sub-project, as well as ten decentralized service sites – one of them located in every capital city of the ten South Sudan States – for the enrollment of ID documents. The decentralized vehicle registration sites, connected to the central site by VSAT, are equipped with high-security printers and number-plate presses for the registration, renewal and production of the documents. ID cards and ePassports, however, are personalized in the capital city. Driver's licenses are issued in a registration center in Juba only, offering pre-registration and issuance of new and renewed documents. For the verification of individuals, documents and vehicles, the traffic police have been equipped with ten mobile handheld devices.

SWISS CONFEDERATION

MILITARY ID CARD

With the Swiss Military ID Card, Mühlbauer delivered a card with a variety of integrated services, such as time recording and various access functions apart from the identification of the card holder. The scope of the project was the delivery of the complete solution for the enrollment of demographic and biometric data and the pre-personalization and personalization of the high-secure military ID card. Moreover, the complete software structure was set up, including per-sonalization management, data and document management, data matching with the national registry, as well as user management components.

A special solution approach is the biometric enrollment by MB Self-Enrollment Kiosks: After receiving the conscription order, all recruits have to undergo medical examination during which their personal data are requested from the national registry and processed by operators via webportal. The military

recruits then perform the additional biometric enrollment (face and signature) themselves on the Self-Enrollment Kiosks. This set of data is then combined with the demographic dataset. The enrolled data is processed and transferred to a military server at the central site. Additionally, data can be enrolled via webportal for different user groups such as external contractors, meeting the high-security requirements.

Every site is, equipped with personalization systems, thus enabling the decentralized personalization and issuance of the military ID card at site, right after examination.

Via webportal, the administrator orders blank documents, which are equipped with state-of-the-art security features from the central warehouse. Thus, the personalization and issuance of the military ID card can be performed autonomously and independently from the central site.
